

ABSTRACT

Milk powder is a food containing good nutritional value.
It ^{can be} ~~is~~ contaminated very ^{easily} soon.

Studies were carried out on manufacture of powder, to observe the high contamination stages during the process of milk.

At first, milk testings and powder testings were studied. Then the microbiological testings of powder were carried out.

Then the high contamination stages of the powder was tested in the process line.

The factory premises, operators, and machines must be cleaned to avoid the contaminations.
